

EUROPA Installation

1. EUROPA Installation

1. Supported Platforms

EUROPA Installation

Note : Starting with EUROPA 2.1.2 (available on Sept 2, 2008), EUROPA is provided in a binary distribution as described here, for older versions, you will have to build EUROPA yourself as decribed [here](#).

Supported Platforms

EUROPA is currently supported on Linux, Mac OS, and Solaris. Some users have been able to run EUROPA on Windows using cygwin; this is not officially supported yet but we are planning to add support for it in the near future. See [here](#) for information on buliding EUROPA in cygwin

A platform is officially supported if and only if there is an automated build regularly scheduled for it. You can see details of the environments used for the automated builds [here](#).
